YAOXING LI

SOFTWARE ENGINEERING STUDENT

liexx999@163.com / +86 15301698659
github.com/Liexx666

EDUCATION

Monash University

Bachelor of Software Engineering (Honours)

Feb 2025 - End of 2028 (expected)

Entering third year in Semester 1, 2027

WAM 75.4 / GPA 3.0
IELTS 6.5

TECHNICAL TOOLS

Programming & Systems

Java, Python, C++
Linux, Shell scripting

Collaboration & Delivery

Git, GitHub, GitLab
Jira, Scrum iterations
Google Docs, Word, Excel

CERTIFICATES & STUDY

TestMu AI
Professional Certificate

Software Testing
Test Automation

Further Study

ISTQB 4.0+ Foundation Level exam preparation

Test-Driven Development (TDD)

Agile software development and code quality

PROJECT EXPERIENCE

Roguelike Game

Java / GitHub - Team of four

github.com/Liexx666/fit2099-Roguelike-game

Implemented interactions between the player, map objects and enemies; handled trigger conditions and state changes, and synchronised results with the game interface.

Checked interface values against internal data before and after interactions, merged code with teammates, and completed functional testing, integration verification and the course demonstration.

AgileFlow - Agile Project Management

Python / Django / GitLab / Jira - Team QA

agileflow-deploy.onrender.com/login/

Boards & Task Management

Implemented sign-in/out, task creation and assignment, and drag-and-drop cards. Contributed to Sprint boards and burndown charts so the team could update task status and track remaining iteration work.

Quality Assurance & Regression Testing

Served as team QA, designing and executing test cases against acceptance criteria. Verified page interactions, API responses and access permissions, and recorded defect reproduction steps and expected results.

Reproduced work-time attribution errors across midnight and precision issues in short time records. Rechecked page and API results after fixes; all 40 Django automated checks passed, including 6 time-precision checks.

ALGORITHMS & TEST AUTOMATION

Data Structures & Algorithms

Selected linked lists, stacks, queues, hash tables, binary search trees and heaps for lookup, insertion and priority scheduling. Implemented merge sort using divide and conquer, maintained AVL tree balance through rotations, and compared best/worst-case time complexity and space costs.

Python Testing Practice

Used pytest for parametrised test cases, exception assertions and fixtures; isolated dependencies with monkeypatch and checked coverage with pytest-cov.
